

SOME REMARKS ON COMPARISON FUNCTIONS

A. AUGUSTYNOWICZ

We try to answer a few questions associated with comparison Perron and Kamke functions. For instance, we consider the questions

- ω is Perron function and $\lambda > 0 \Rightarrow \lambda\omega$ is Perron function ?
 - ω is Perron function and ρ is Lipschitz function $\Rightarrow \omega + \rho$ is Perron function ?
 - ω is a comparison function $\Rightarrow \omega$ is bounded by a comparison function with separated variable ?
 - what functions with separated variables are comparison functions ?
- and others.
